Chapter 1

Main Page

1.1 About

primesieve is a C/C++ library for fast prime number generation. It generates the primes below 10^9 in just 0.2 seconds on a single core of an Intel Core i7-6700 3.4GHz CPU. primesieve can generate primes and prime k-tuplets up to 2^64. primesieve's memory requirement is about pi(sqrt(n)) * 8 bytes per thread, its run-time complexity is O(n log log n) operations. The recommended way to get started is to first have a look at a few C or C++ example programs. The most common use cases are storing primes in a vector (or array) and iterating over primes using next_prime() or previous_prime().

For more information please visit http://primesieve.org.

1.2 C++ API

- primesieve.hpp - primesieve C++ header.
- store_primes_in_vector.cpp - Example that shows how to store primes in a std::vector.
- primesieve_iterator.cpp - Example that shows how to iterate over primes using primesieve::iterator.
- count_primes.cpp - Example that shows how to count primes.

1.3 C API

- primesieve.h - primesieve C header.
- store_primes_in_array.c - Example that shows how to store primes in an array.
- primesieve_iterator.c - Example that shows how to iterate over primes using primesieve_iterator .
- count_primes.c - Example that shows how to count primes.

Namespace Index

2.1 Namespace List

Here is a list of all documented namespaces with brief descriptions:

primesieve
Contains primesieve's C++ functions and classes 11

Chapter 3

Hierarchical Index

3.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

primesieve::Callback< T > 17
primesieve::iterator 17
primesieve_iterator 21
runtime_error
    primesieve::primesieve_error 19

Chapter 4

Class Index

4.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

primesieve::Callback< T >
: Callback interface class 17
primesieve::iterator
: Primesieve::iterator allows to easily iterate over primes both forwards and backwards 17
primesieve::primesieve_error
: Primesieve throws a primesieve_error exception if an error occurs that cannot be handled e.g . 19
primesieve_iterator
: C prime iterator, please refer to primesieve_iterator.h for more information 21

Chapter 5

File Index

5.1 File List

Here is a list of all documented files with brief descriptions:

Callback.hpp
Callback interface classes 23
iterator.hpp
The iterator class allows to easily iterate (forward and backward) over prime numbers 24
primesieve.h
Primesieve C API 25
primesieve.hpp
Primesieve C++ API 32
primesieve_error.hpp
The primesieve_error class is used for all exceptions within primesieve 34
primesieve_iterator.h
Primesieve_iterator allows to easily iterate over primes both forwards and backwards 35

Chapter 6

Namespace Documentation

6.1 primesieve Namespace Reference

Contains primesieve's C++ functions and classes.

Classes

- class Callback

  callback interface class.
- class iterator

  primesieve::iterator allows to easily iterate over primes both forwards and backwards.
- class primesieve_error

  primesieve throws a primesieve_error exception if an error occurs that cannot be handled e.g.

Functions

- template<typename T >
  void generate_primes (uint64_t stop, std::vector< T > *primes)

  Store the primes <= stop in the primes vector.
- template<typename T >
  void generate_primes (uint64_t start, uint64_t stop, std::vector< T > *primes)

  Store the primes within the interval [start, stop] in the primes vector.
- template<typename T >
  void generate_n_primes (uint64_t n, std::vector< T > *primes)

  Store the first n primes in the primes vector.
- template<typename T >
  void generate_n_primes (uint64_t n, uint64_t start, std::vector< T > *primes)

  Store the first n primes >= start in the primes vector.
- uint64_t nth_prime (int64_t n, uint64_t start=0)

  Find the nth prime.
- uint64_t parallel_nth_prime (int64_t n, uint64_t start=0)

  Find the nth prime in parallel.
- uint64_t count_primes (uint64_t start, uint64_t stop)

  Count the primes within the interval [start, stop].
- uint64_t count_twins (uint64_t start, uint64_t stop)

Count the twin primes within the interval [start, stop].

- uint64_t count_triplets (uint64_t start, uint64_t stop)

  Count the prime triplets within the interval [start, stop].
- uint64_t count_quadruplets (uint64_t start, uint64_t stop)

  Count the prime quadruplets within the interval [start, stop].
- uint64_t count_quintuplets (uint64_t start, uint64_t stop)

  Count the prime quintuplets within the interval [start, stop].
- uint64_t count_sextuplets (uint64_t start, uint64_t stop)

  Count the prime sextuplets within the interval [start, stop].
- uint64_t parallel_count_primes (uint64_t start, uint64_t stop)

  Count the primes within the interval [start, stop] in parallel.
- uint64_t parallel_count_twins (uint64_t start, uint64_t stop)

  Count the twin primes within the interval [start, stop] in parallel.
- uint64_t parallel_count_triplets (uint64_t start, uint64_t stop)

  Count the prime triplets within the interval [start, stop] in parallel.
- uint64_t parallel_count_quadruplets (uint64_t start, uint64_t stop)

  Count the prime quadruplets within the interval [start, stop] in parallel.
- uint64_t parallel_count_quintuplets (uint64_t start, uint64_t stop)

  Count the prime quintuplets within the interval [start, stop] in parallel.
- uint64_t parallel_count_sextuplets (uint64_t start, uint64_t stop)

  Count the prime sextuplets within the interval [start, stop] in parallel.
- void print_primes (uint64_t start, uint64_t stop)

  Print the primes within the interval [start, stop] to the standard output.
- void print_twins (uint64_t start, uint64_t stop)

  Print the twin primes within the interval [start, stop] to the standard output.
- void print_triplets (uint64_t start, uint64_t stop)

  Print the prime triplets within the interval [start, stop] to the standard output.
- void print_quadruplets (uint64_t start, uint64_t stop)

  Print the prime quadruplets within the interval [start, stop] to the standard output.
- void print_quintuplets (uint64_t start, uint64_t stop)

  Print the prime quintuplets within the interval [start, stop] to the standard output.
- void print_sextuplets (uint64_t start, uint64_t stop)

  Print the prime sextuplets within the interval [start, stop] to the standard output.
- void callback_primes (uint64_t start, uint64_t stop, void(∗callback)(uint64_t prime))

  Call back the primes within the interval [start, stop].
- void callback_primes (uint64_t start, uint64_t stop, primesieve::Callback< uint64_t > ∗callback)

  Call back the primes within the interval [start, stop].
- int get_sieve_size ()

  Get the current set sieve size in kilobytes.
- int get_num_threads ()

  Get the current set number of threads.
- uint64_t get_max_stop ()

  Returns the largest valid stop number for primesieve.
- void set_sieve_size (int sieve_size)

  Set the sieve size in kilobytes.
- void set_num_threads (int num_threads)

  Set the number of threads for use in subsequent primesieve::parallel_∗ function calls.
- bool primesieve_test ()

  Run extensive correctness tests.
- std::string primesieve_version ()

  Get the primesieve version number, in the form "i.j.k".

6.1.1 Detailed Description

Contains primesieve's C++ functions and classes.

6.1.2 Function Documentation

6.1.2.1 callback_primes() [1/2]

```
void primesieve::callback_primes (
            uint64_t start,
            uint64_t stop,
            void(*)(uint64_t prime) callback )
```

Call back the primes within the interval [start, stop].

Parameters

callback	A callback function.

Examples:

callback_primes.cpp.

6.1.2.2 callback_primes() [2/2]

```
void primesieve::callback_primes (
            uint64_t start,
            uint64_t stop,
            primesieve::Callback< uint64_t > * callback )
```

Call back the primes within the interval [start, stop].

Parameters

callback	An object derived from primesieve::Callback<uint64_t>.

6.1.2.3 get_max_stop()

```
uint64_t primesieve::get_max_stop ( )
```

Returns the largest valid stop number for primesieve.

Returns

2^64-1 (UINT64_MAX).

6.1.2.4 nth_prime()

```
uint64_t primesieve::nth_prime (
            int64_t n,
            uint64_t start = 0 )
```

Find the nth prime.

Parameters

n	if n = 0 finds the 1st prime >= start, if n > 0 finds the nth prime > start, if n < 0 finds the nth prime < start (backwards).

Examples:

nth_prime.cpp.

6.1.2.5 parallel_count_primes()

```
uint64_t primesieve::parallel_count_primes (
            uint64_t start,
            uint64_t stop )
```

Count the primes within the interval [start, stop] in parallel.

By default all CPU cores are used, use primesieve::set_num_threads(int) to change the number of threads.

Examples:

count_primes.cpp.

6.1.2.6 parallel_count_quadruplets()

```
uint64_t primesieve::parallel_count_quadruplets (
            uint64_t start,
            uint64_t stop )
```

Count the prime quadruplets within the interval [start, stop] in parallel.

By default all CPU cores are used, use primesieve::set_num_threads(int) to change the number of threads.

6.1.2.7 parallel_count_quintuplets()

```
uint64_t primesieve::parallel_count_quintuplets (
            uint64_t start,
            uint64_t stop )
```

Count the prime quintuplets within the interval [start, stop] in parallel.

By default all CPU cores are used, use primesieve::set_num_threads(int) to change the number of threads.

6.1.2.8 parallel_count_sextuplets()

```
uint64_t primesieve::parallel_count_sextuplets (
            uint64_t start,
            uint64_t stop )
```

Count the prime sextuplets within the interval [start, stop] in parallel.

By default all CPU cores are used, use primesieve::set_num_threads(int) to change the number of threads.

6.1.2.9 parallel_count_triplets()

```
uint64_t primesieve::parallel_count_triplets (
            uint64_t start,
            uint64_t stop )
```

Count the prime triplets within the interval [start, stop] in parallel.

By default all CPU cores are used, use primesieve::set_num_threads(int) to change the number of threads.

6.1.2.10 parallel_count_twins()

```
uint64_t primesieve::parallel_count_twins (
            uint64_t start,
            uint64_t stop )
```

Count the twin primes within the interval [start, stop] in parallel.

By default all CPU cores are used, use primesieve::set_num_threads(int) to change the number of threads.

6.1.2.11 parallel_nth_prime()

```
uint64_t primesieve::parallel_nth_prime (
            int64_t n,
            uint64_t start = 0 )
```

Find the nth prime in parallel.

By default all CPU cores are used, use primesieve::set_num_threads(int) to change the number of threads.

Parameters

n	if n = 0 finds the 1st prime >= start, if n > 0 finds the nth prime > start, if n < 0 finds the nth prime < start (backwards).

6.1.2.12 primesieve_test()

```
bool primesieve::primesieve_test ( )
```

Run extensive correctness tests.

The tests last about one minute on a quad core CPU from 2013 and use up to 1 gigabyte of memory.

Returns

true if success else false.

6.1.2.13 set_sieve_size()

```
void primesieve::set_sieve_size (
             int sieve_size )
```

Set the sieve size in kilobytes.

The best sieving performance is achieved with a sieve size of your CPU's L1 data cache size (per core). For sieving >= 10^17 a sieve size of your CPU's L2 cache size sometimes performs better.

Parameters

sieve_size	Sieve size in kilobytes.

Precondition

sieve_size >= 1 && sieve_size <= 2048.

Chapter 7

Class Documentation

7.1 primesieve::Callback< T > Class Template Reference

callback interface class.

`#include <Callback.hpp>`

Public Member Functions

- virtual void **callback** (T prime)=0

7.1.1 Detailed Description

template<typename T>
class primesieve::Callback< T >

callback interface class.

Objects derived from this class can be passed to the primesieve::generate_primes() functions.

Parameters

T	must be uint64_t.

The documentation for this class was generated from the following file:

- Callback.hpp

7.2 primesieve::iterator Class Reference

primesieve::iterator allows to easily iterate over primes both forwards and backwards.

`#include <iterator.hpp>`

Public Member Functions

- iterator (uint64_t start=0, uint64_t stop_hint=get_max_stop())

  Create a new iterator object.
- void skipto (uint64_t start, uint64_t stop_hint=get_max_stop())

  Reinitialize this iterator object to start.
- uint64_t next_prime ()

  Advance the iterator by one position.
- uint64_t previous_prime ()

  Get the previous prime, or 0 if input <= 2 e.g.

7.2.1 Detailed Description

primesieve::iterator allows to easily iterate over primes both forwards and backwards.

Generating the first prime has a complexity of O(r log log r) operations with r = n^0.5, after that any additional prime is generated in amortized O(log n log log n) operations. The memory usage is about pi(n^0.5) * 16 bytes. primesieve::iterator objects are very convenient to use at the cost of being slightly slower than the callback_primes() functions.

Examples:

previous_prime.cpp, and primesieve_iterator.cpp.

7.2.2 Constructor & Destructor Documentation

7.2.2.1 iterator()

```
primesieve::iterator::iterator (
            uint64_t start = 0,
            uint64_t stop_hint = get_max_stop() )
```

Create a new iterator object.

Parameters

start	Generate primes > start (or < start).
stop_hint	Stop number optimization hint, gives significant speed up if few primes are generated. E.g. if you want to generate the primes below 1000 use stop_hint = 1000.

7.2.3 Member Function Documentation

7.2.3.1 next_prime()

```
uint64_t primesieve::iterator::next_prime ( )  [inline]
```

Advance the iterator by one position.

Returns

The next prime.

Examples:

primesieve_iterator.cpp.

7.2.3.2 previous_prime()

```
uint64_t primesieve::iterator::previous_prime ( )  [inline]
```

Get the previous prime, or 0 if input <= 2 e.g.

previous_prime(2) = 0.

Examples:

previous_prime.cpp.

7.2.3.3 skipto()

```
void primesieve::iterator::skipto (
            uint64_t start,
            uint64_t stop_hint = get_max_stop() )
```

Reinitialize this iterator object to start.

Parameters

start	Generate primes > start (or < start).
stop_hint	Stop number optimization hint, gives significant speed up if few primes are generated. E.g. if you want to generate the primes below 1000 use stop_hint = 1000.

Examples:

previous_prime.cpp.

The documentation for this class was generated from the following file:

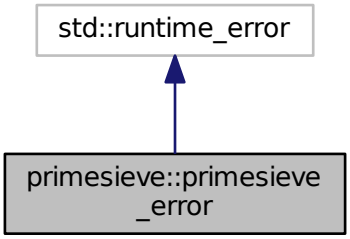
- iterator.hpp

7.3 primesieve::primesieve_error Class Reference

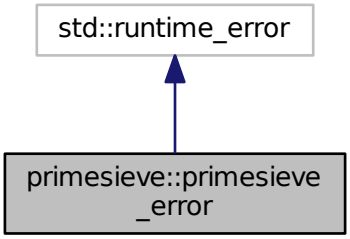
primesieve throws a primesieve_error exception if an error occurs that cannot be handled e.g.

```
#include <primesieve_error.hpp>
```

Inheritance diagram for primesieve::primesieve_error:



Collaboration diagram for primesieve::primesieve_error:



Public Member Functions

- **primesieve_error** (const std::string &msg)

7.3.1 Detailed Description

primesieve throws a primesieve_error exception if an error occurs that cannot be handled e.g.

stop > primesieve::max_stop().

The documentation for this class was generated from the following file:

- primesieve_error.hpp

7.4 primesieve_iterator Struct Reference

C prime iterator, please refer to primesieve_iterator.h for more information.

```
#include <primesieve_iterator.h>
```

Public Attributes

- size_t **i_**
- size_t **last_idx_**
- uint64_t * **primes_**
- uint64_t * **primes_pimpl_**
- uint64_t **start_**
- uint64_t **stop_**
- uint64_t **stop_hint_**
- uint64_t **tiny_cache_size_**
- int **is_error_**

7.4.1 Detailed Description

C prime iterator, please refer to primesieve_iterator.h for more information.

Examples:

previous_prime.c, and primesieve_iterator.c.

The documentation for this struct was generated from the following file:

- primesieve_iterator.h

Chapter 8

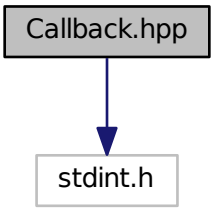
File Documentation

8.1 Callback.hpp File Reference

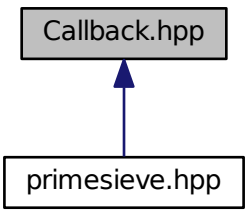
Callback interface classes.

```
#include <stdint.h>
```

Include dependency graph for Callback.hpp:



This graph shows which files directly or indirectly include this file:



Classes

- class primesieve::Callback< T >
  callback interface class.

Namespaces

- primesieve
  Contains primesieve's C++ functions and classes.

8.1.1 Detailed Description

Callback interface classes.

Copyright (C) 2015 Kim Walisch, kim.walisch@gmail.com

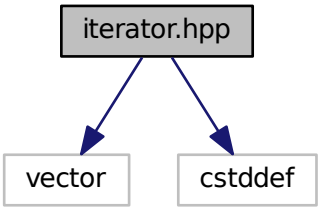
This file is distributed under the BSD License. See the COPYING file in the top level directory.

8.2 iterator.hpp File Reference

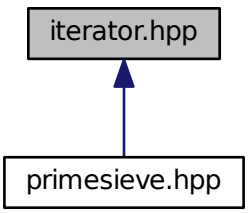
The iterator class allows to easily iterate (forward and backward) over prime numbers.

```
#include <vector>
#include <cstddef>
```

Include dependency graph for iterator.hpp:



This graph shows which files directly or indirectly include this file:



Classes

- class primesieve::iterator

  primesieve::iterator allows to easily iterate over primes both forwards and backwards.

Namespaces

- primesieve

  Contains primesieve's C++ functions and classes.

Functions

- uint64_t primesieve::get_max_stop ()

  Returns the largest valid stop number for primesieve.

8.2.1 Detailed Description

The iterator class allows to easily iterate (forward and backward) over prime numbers.

Copyright (C) 2016 Kim Walisch, kim.walisch@gmail.com

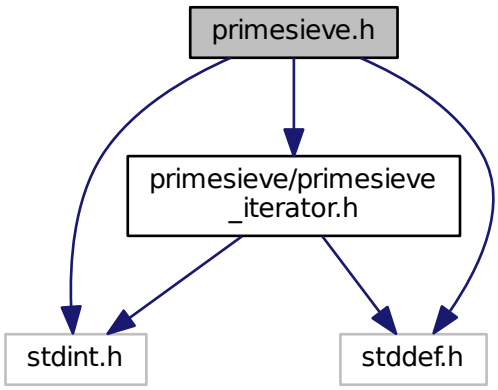
This file is distributed under the BSD License. See the COPYING file in the top level directory.

8.3 primesieve.h File Reference

primesieve C API.

```
#include <primesieve/primesieve_iterator.h>
#include <stdint.h>
#include <stddef.h>
```

Include dependency graph for primesieve.h:



Macros

- #define **PRIMESIEVE_VERSION** "5.7.2"
- #define **PRIMESIEVE_VERSION_MAJOR** 5
- #define **PRIMESIEVE_VERSION_MINOR** 7
- #define **PRIMESIEVE_VERSION_PATCH** 2
- #define PRIMESIEVE_ERROR ((uint64_t) ∼((uint64_t) 0))

  primesieve functions return PRIMESIEVE_ERROR (UINT64_MAX) if any error occurs.

Enumerations

- enum {
  SHORT_PRIMES, USHORT_PRIMES, INT_PRIMES, UINT_PRIMES,
  LONG_PRIMES, ULONG_PRIMES, LONGLONG_PRIMES, ULONGLONG_PRIMES,
  INT16_PRIMES, UINT16_PRIMES, INT32_PRIMES, UINT32_PRIMES,
  INT64_PRIMES, UINT64_PRIMES }

Functions

- void ∗ primesieve_generate_primes (uint64_t start, uint64_t stop, size_t ∗size, int type)

  Get an array with the primes inside the interval [start, stop].
- void ∗ primesieve_generate_n_primes (uint64_t n, uint64_t start, int type)

  Get an array with the first n primes >= start.
- uint64_t primesieve_nth_prime (int64_t n, uint64_t start)

  Find the nth prime.
- uint64_t primesieve_parallel_nth_prime (int64_t n, uint64_t start)

  Find the nth prime in parallel.
- uint64_t primesieve_count_primes (uint64_t start, uint64_t stop)

  Count the primes within the interval [start, stop].
- uint64_t primesieve_count_twins (uint64_t start, uint64_t stop)

  Count the twin primes within the interval [start, stop].
- uint64_t primesieve_count_triplets (uint64_t start, uint64_t stop)

  Count the prime triplets within the interval [start, stop].
- uint64_t primesieve_count_quadruplets (uint64_t start, uint64_t stop)

  Count the prime quadruplets within the interval [start, stop].
- uint64_t primesieve_count_quintuplets (uint64_t start, uint64_t stop)

  Count the prime quintuplets within the interval [start, stop].
- uint64_t primesieve_count_sextuplets (uint64_t start, uint64_t stop)

  Count the prime sextuplets within the interval [start, stop].
- uint64_t primesieve_parallel_count_primes (uint64_t start, uint64_t stop)

  Count the primes within the interval [start, stop] in parallel.
- uint64_t primesieve_parallel_count_twins (uint64_t start, uint64_t stop)

  Count the twin primes within the interval [start, stop] in parallel.
- uint64_t primesieve_parallel_count_triplets (uint64_t start, uint64_t stop)

  Count the prime triplets within the interval [start, stop] in parallel.
- uint64_t primesieve_parallel_count_quadruplets (uint64_t start, uint64_t stop)

  Count the prime quadruplets within the interval [start, stop] in parallel.
- uint64_t primesieve_parallel_count_quintuplets (uint64_t start, uint64_t stop)

  Count the prime quintuplets within the interval [start, stop] in parallel.
- uint64_t primesieve_parallel_count_sextuplets (uint64_t start, uint64_t stop)

Count the prime sextuplets within the interval [start, stop] in parallel.

- void primesieve_print_primes (uint64_t start, uint64_t stop)

  Print the primes within the interval [start, stop] to the standard output.
- void primesieve_print_twins (uint64_t start, uint64_t stop)

  Print the twin primes within the interval [start, stop] to the standard output.
- void primesieve_print_triplets (uint64_t start, uint64_t stop)

  Print the prime triplets within the interval [start, stop] to the standard output.
- void primesieve_print_quadruplets (uint64_t start, uint64_t stop)

  Print the prime quadruplets within the interval [start, stop] to the standard output.
- void primesieve_print_quintuplets (uint64_t start, uint64_t stop)

  Print the prime quintuplets within the interval [start, stop] to the standard output.
- void primesieve_print_sextuplets (uint64_t start, uint64_t stop)

  Print the prime sextuplets within the interval [start, stop] to the standard output.
- void primesieve_callback_primes (uint64_t start, uint64_t stop, void(∗callback)(uint64_t prime))

  Call back the primes within the interval [start, stop].
- int primesieve_get_sieve_size ()

  Get the current set sieve size in kilobytes.
- int primesieve_get_num_threads ()

  Get the current set number of threads.
- uint64_t primesieve_get_max_stop ()

  Returns the largest valid stop number for primesieve.
- void primesieve_set_sieve_size (int sieve_size)

  Set the sieve size in kilobytes.
- void primesieve_set_num_threads (int num_threads)

  Set the number of threads for use in subsequent primesieve_parallel_∗ function calls.
- void primesieve_free (void ∗primes)

  Deallocate a primes array created using the primesieve_generate_primes() or primesieve_generate_n_primes() functions.
- int primesieve_test ()

  Run extensive correctness tests.
- const char ∗ primesieve_version ()

  Get the primesieve version number, in the form "i.j.k"

8.3.1 Detailed Description

primesieve C API.

primesieve is a library for fast prime number generation. In case an error occurs errno is set to EDOM and PRIM↩ ESIEVE_ERROR is returned.

8.3.2 Enumeration Type Documentation

8.3.2.1 anonymous enum

```
anonymous enum
```

Enumerator

SHORT_PRIMES	Generate primes of short type.
USHORT_PRIMES	Generate primes of unsigned short type.
INT_PRIMES	Generate primes of int type.
UINT_PRIMES	Generate primes of unsigned int type.
LONG_PRIMES	Generate primes of long type.
ULONG_PRIMES	Generate primes of unsigned long type.
LONGLONG_PRIMES	Generate primes of long long type.
ULONGLONG_PRIMES	Generate primes of unsigned long long type.
INT16_PRIMES	Generate primes of int16_t type.
UINT16_PRIMES	Generate primes of uint16_t type.
INT32_PRIMES	Generate primes of int32_t type.
UINT32_PRIMES	Generate primes of uint32_t type.
INT64_PRIMES	Generate primes of int64_t type.
UINT64_PRIMES	Generate primes of uint64_t type.

8.3.3 Function Documentation

8.3.3.1 primesieve_callback_primes()

```
void primesieve_callback_primes (
             uint64_t start,
             uint64_t stop,
             void(*)(uint64_t prime) callback )
```

Call back the primes within the interval [start, stop].

Parameters

callback	A callback function.

8.3.3.2 primesieve_generate_n_primes()

```
void* primesieve_generate_n_primes (
             uint64_t n,
             uint64_t start,
             int type )
```

Get an array with the first n primes >= start.

Parameters

type	The type of the primes to generate, e.g. INT_PRIMES.

Examples:

store_primes_in_array.c.

8.3.3.3 primesieve_generate_primes()

```
void* primesieve_generate_primes (
            uint64_t start,
            uint64_t stop,
            size_t * size,
            int type )
```

Get an array with the primes inside the interval [start, stop].

Parameters

size	The size of the returned primes array.
type	The type of the primes to generate, e.g. INT_PRIMES.

Examples:

store_primes_in_array.c.

8.3.3.4 primesieve_get_max_stop()

```
uint64_t primesieve_get_max_stop ( )
```

Returns the largest valid stop number for primesieve.

Returns

2^64-1 (UINT64_MAX).

8.3.3.5 primesieve_nth_prime()

```
uint64_t primesieve_nth_prime (
            int64_t n,
            uint64_t start )
```

Find the nth prime.

Parameters

n	if n = 0 finds the 1st prime >= start, if n > 0 finds the nth prime > start, if n < 0 finds the nth prime < start (backwards).

Examples:

nth_prime.c.

8.3.3.6 primesieve_parallel_count_primes()

```
uint64_t primesieve_parallel_count_primes (
             uint64_t start,
             uint64_t stop )
```

Count the primes within the interval [start, stop] in parallel.

By default all CPU cores are used, use primesieve_set_num_threads(int) to change the number of threads.

Examples:

count_primes.c.

8.3.3.7 primesieve_parallel_count_quadruplets()

```
uint64_t primesieve_parallel_count_quadruplets (
             uint64_t start,
             uint64_t stop )
```

Count the prime quadruplets within the interval [start, stop] in parallel.

By default all CPU cores are used, use primesieve_set_num_threads(int) to change the number of threads.

8.3.3.8 primesieve_parallel_count_quintuplets()

```
uint64_t primesieve_parallel_count_quintuplets (
             uint64_t start,
             uint64_t stop )
```

Count the prime quintuplets within the interval [start, stop] in parallel.

By default all CPU cores are used, use primesieve_set_num_threads(int) to change the number of threads.

8.3.3.9 primesieve_parallel_count_sextuplets()

```
uint64_t primesieve_parallel_count_sextuplets (
             uint64_t start,
             uint64_t stop )
```

Count the prime sextuplets within the interval [start, stop] in parallel.

By default all CPU cores are used, use primesieve_set_num_threads(int) to change the number of threads.

8.3.3.10 primesieve_parallel_count_triplets()

```
uint64_t primesieve_parallel_count_triplets (
             uint64_t start,
             uint64_t stop )
```

Count the prime triplets within the interval [start, stop] in parallel.

By default all CPU cores are used, use primesieve_set_num_threads(int) to change the number of threads.

8.3.3.11 primesieve_parallel_count_twins()

```
uint64_t primesieve_parallel_count_twins (
             uint64_t start,
             uint64_t stop )
```

Count the twin primes within the interval [start, stop] in parallel.

By default all CPU cores are used, use primesieve_set_num_threads(int) to change the number of threads.

8.3.3.12 primesieve_parallel_nth_prime()

```
uint64_t primesieve_parallel_nth_prime (
             int64_t n,
             uint64_t start )
```

Find the nth prime in parallel.

By default all CPU cores are used, use primesieve_set_num_threads(int) to change the number of threads.

Parameters

n	if n = 0 finds the 1st prime >= start, if n > 0 finds the nth prime > start, if n < 0 finds the nth prime < start (backwards).

8.3.3.13 primesieve_set_sieve_size()

```
void primesieve_set_sieve_size (
             int sieve_size )
```

Set the sieve size in kilobytes.

The best sieving performance is achieved with a sieve size of your CPU's L1 data cache size (per core). For sieving >= 10^17 a sieve size of your CPU's L2 cache size sometimes performs better.

Parameters

sieve_size	Sieve size in kilobytes.

Precondition

sieve_size >= 1 && <= 2048.

8.3.3.14 primesieve_test()

```
int primesieve_test ( )
```

Run extensive correctness tests.

The tests last about one minute on a quad core CPU from 2013 and use up to 1 gigabyte of memory.

Returns

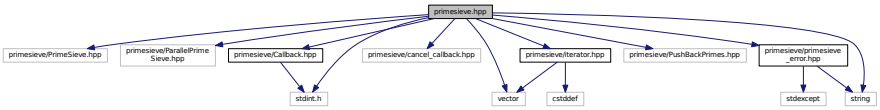
1 if success, 0 if error.

8.4 primesieve.hpp File Reference

primesieve C++ API.

```
#include <primesieve/PrimeSieve.hpp>
#include <primesieve/ParallelPrimeSieve.hpp>
#include <primesieve/Callback.hpp>
#include <primesieve/cancel_callback.hpp>
#include <primesieve/iterator.hpp>
#include <primesieve/PushBackPrimes.hpp>
#include <primesieve/primesieve_error.hpp>
#include <stdint.h>
#include <vector>
#include <string>
```

Include dependency graph for primesieve.hpp:



Namespaces

- #define **PRIMESIEVE_VERSION_PATCH** 2

Functions

- template<typename T >
  void primesieve::generate_primes (uint64_t stop, std::vector< T > *primes)

  Store the primes <= stop in the primes vector.
- template<typename T >
  void primesieve::generate_primes (uint64_t start, uint64_t stop, std::vector< T > *primes)

  Store the primes within the interval [start, stop] in the primes vector.
- template<typename T >
  void primesieve::generate_n_primes (uint64_t n, std::vector< T > *primes)

  Store the first n primes in the primes vector.

- template<typename T >
  void primesieve::generate_n_primes (uint64_t n, uint64_t start, std::vector< T > *primes)

  Store the first n primes >= start in the primes vector.
- uint64_t primesieve::nth_prime (int64_t n, uint64_t start=0)

  Find the nth prime.
- uint64_t primesieve::parallel_nth_prime (int64_t n, uint64_t start=0)

  Find the nth prime in parallel.
- uint64_t primesieve::count_primes (uint64_t start, uint64_t stop)

  Count the primes within the interval [start, stop].
- uint64_t primesieve::count_twins (uint64_t start, uint64_t stop)

  Count the twin primes within the interval [start, stop].
- uint64_t primesieve::count_triplets (uint64_t start, uint64_t stop)

  Count the prime triplets within the interval [start, stop].
- uint64_t primesieve::count_quadruplets (uint64_t start, uint64_t stop)

  Count the prime quadruplets within the interval [start, stop].
- uint64_t primesieve::count_quintuplets (uint64_t start, uint64_t stop)

  Count the prime quintuplets within the interval [start, stop].
- uint64_t primesieve::count_sextuplets (uint64_t start, uint64_t stop)

  Count the prime sextuplets within the interval [start, stop].
- uint64_t primesieve::parallel_count_primes (uint64_t start, uint64_t stop)

  Count the primes within the interval [start, stop] in parallel.
- uint64_t primesieve::parallel_count_twins (uint64_t start, uint64_t stop)

  Count the twin primes within the interval [start, stop] in parallel.
- uint64_t primesieve::parallel_count_triplets (uint64_t start, uint64_t stop)

  Count the prime triplets within the interval [start, stop] in parallel.
- uint64_t primesieve::parallel_count_quadruplets (uint64_t start, uint64_t stop)

  Count the prime quadruplets within the interval [start, stop] in parallel.
- uint64_t primesieve::parallel_count_quintuplets (uint64_t start, uint64_t stop)

  Count the prime quintuplets within the interval [start, stop] in parallel.
- uint64_t primesieve::parallel_count_sextuplets (uint64_t start, uint64_t stop)

  Count the prime sextuplets within the interval [start, stop] in parallel.
- void primesieve::print_primes (uint64_t start, uint64_t stop)

  Print the primes within the interval [start, stop] to the standard output.
- void primesieve::print_twins (uint64_t start, uint64_t stop)

  Print the twin primes within the interval [start, stop] to the standard output.
- void primesieve::print_triplets (uint64_t start, uint64_t stop)

  Print the prime triplets within the interval [start, stop] to the standard output.
- void primesieve::print_quadruplets (uint64_t start, uint64_t stop)

  Print the prime quadruplets within the interval [start, stop] to the standard output.
- void primesieve::print_quintuplets (uint64_t start, uint64_t stop)

  Print the prime quintuplets within the interval [start, stop] to the standard output.
- void primesieve::print_sextuplets (uint64_t start, uint64_t stop)

  Print the prime sextuplets within the interval [start, stop] to the standard output.
- void primesieve::callback_primes (uint64_t start, uint64_t stop, void(*callback)(uint64_t prime))

  Call back the primes within the interval [start, stop].
- void primesieve::callback_primes (uint64_t start, uint64_t stop, primesieve::Callback< uint64_t > *callback)

  Call back the primes within the interval [start, stop].
- int primesieve::get_sieve_size ()

  Get the current set sieve size in kilobytes.
- int primesieve::get_num_threads ()

  Get the current set number of threads.

- uint64_t primesieve::get_max_stop ()

  Returns the largest valid stop number for primesieve.
- void primesieve::set_sieve_size (int sieve_size)

  Set the sieve size in kilobytes.
- void primesieve::set_num_threads (int num_threads)

  Set the number of threads for use in subsequent primesieve::parallel_∗ function calls.
- bool primesieve::primesieve_test ()

  Run extensive correctness tests.
- std::string primesieve::primesieve_version ()

  Get the primesieve version number, in the form "i.j.k".

8.4.1 Detailed Description

primesieve C++ API.

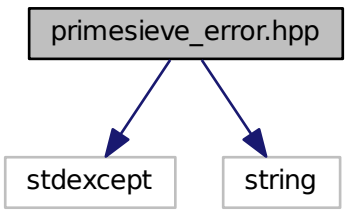
primesieve is a library for fast prime number generation, in case an error occurs a primesieve::primesieve_error exception (derived form std::runtime_error) will be thrown.

8.5 primesieve_error.hpp File Reference

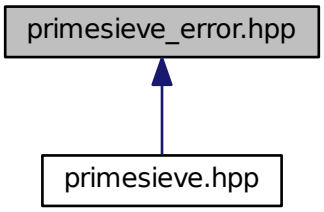
The primesieve_error class is used for all exceptions within primesieve.

```
#include <stdexcept>
#include <string>
```

Include dependency graph for primesieve_error.hpp:



This graph shows which files directly or indirectly include this file:



Classes

- class primesieve::primesieve_error

  primesieve throws a primesieve_error exception if an error occurs that cannot be handled e.g.

Namespaces

- primesieve

  Contains primesieve's C++ functions and classes.

8.5.1 Detailed Description

The primesieve_error class is used for all exceptions within primesieve.

Copyright (C) 2013 Kim Walisch, kim.walisch@gmail.com

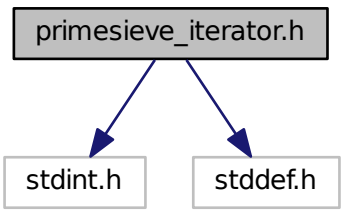
This file is distributed under the BSD License. See the COPYING file in the top level directory.

8.6 primesieve_iterator.h File Reference

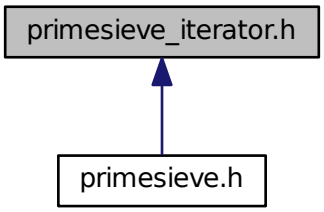
primesieve_iterator allows to easily iterate over primes both forwards and backwards.

```
#include <stdint.h>
#include <stddef.h>
```

Include dependency graph for primesieve_iterator.h:



This graph shows which files directly or indirectly include this file:



Classes

- struct primesieve_iterator

  C prime iterator, please refer to primesieve_iterator.h for more information.

Functions

- void primesieve_init (primesieve_iterator *pi)

  Initialize the primesieve iterator before first using it.
- void primesieve_free_iterator (primesieve_iterator *pi)

  Free all memory.
- void primesieve_skipto (primesieve_iterator *pi, uint64_t start, uint64_t stop_hint)

  Set the primesieve iterator to start.
- static uint64_t primesieve_next_prime (primesieve_iterator *pi)

  Get the next prime.
- static uint64_t primesieve_previous_prime (primesieve_iterator *pi)

  Get the previous prime, or 0 if input <= 2 e.g.

8.6.1 Detailed Description

primesieve_iterator allows to easily iterate over primes both forwards and backwards.

Generating the first prime has a complexity of O(r log log r) operations with r = n^0.5, after that any additional prime is generated in amortized O(log n log log n) operations. The memory usage is about pi(n^0.5) * 16 bytes. primesieve_iterator objects are very convenient to use at the cost of being slightly slower than the primesieve_callback_primes() functions.

The primesieve_iterator.c example shows how to use primesieve_iterator. If any error occurs errno is set to EDOM and primesieve_next_prime() and primesieve_previous_prime() return PRIMESIEVE_ERROR.

8.6.2 Function Documentation

8.6.2.1 primesieve_previous_prime()

```
static uint64_t primesieve_previous_prime (
            primesieve_iterator * pi )  [inline], [static]
```

Get the previous prime, or 0 if input <= 2 e.g.

previous_prime(2) = 0.

Examples:

previous_prime.c.

8.6.2.2 primesieve_skipto()

```
void primesieve_skipto (
            primesieve_iterator * pi,
            uint64_t start,
            uint64_t stop_hint )
```

Set the primesieve iterator to start.

Parameters

start	Generate primes > start (or < start).
stop_hint	Stop number optimization hint. E.g. if you want to generate the primes below 1000 use stop_hint = 1000, if you don't know use primesieve_get_max_stop().

Examples:

previous_prime.c.

Chapter 9

Example Documentation

9.1 callback_primes.cpp

This example shows how to use callback functions.

```
#include <primesieve.hpp>
#include <stdint.h>
#include <iostream>

void callback(uint64_t prime)
{
  std::cout << prime << std::endl;
}

int main()
{
  primesieve::callback_primes(2, 1000, callback);
  return 0;
}
```

9.2 count_primes.c

C program that shows how to count primes.

```
#include <primesieve.h>
#include <inttypes.h>
#include <stdio.h>

int main()
{
  uint64_t count = primesieve_count_primes(0, 1000);
  printf("Primes below 1000 = %" PRIu64 "\n", count);

  /* use multi-threading for large intervals */
  count = primesieve_parallel_count_primes(0, 1000000000);
  printf("Primes below 10^9 = %" PRIu64 "\n", count);

  return 0;
}
```

9.3 count_primes.cpp

This example shows how to count primes.

```
#include <primesieve.hpp>
#include <stdint.h>
#include <iostream>

int main()
{
  uint64_t count = primesieve::count_primes(0, 1000);
  std::cout << "Primes below 1000 = " << count << std::endl;

  uint64_t stop = 1000000000;

  // use multi-threading for large intervals
  count = primesieve::parallel_count_primes(0, stop);
  std::cout << "Primes below 10^9 = " << count << std::endl;

  return 0;
}
```

9.4 nth_prime.c

C program that finds the nth prime.

```
#include <primesieve.h>
#include <stdlib.h>
#include <inttypes.h>
#include <stdio.h>

int main(int argc, char** argv)
{
  uint64_t n = 1000;
  if (argv[1])
    n = atol(argv[1]);

  uint64_t prime = primesieve_nth_prime(n, 0);
  printf("%" PRIu64 "th prime = %" PRIu64 "\n", n, prime);

  return 0;
}
```

9.5 nth_prime.cpp

Find the nth prime.

```
#include <primesieve.hpp>
#include <stdint.h>
#include <iostream>
#include <cstdlib>

int main(int, char** argv)
{
  uint64_t n = 1000;
  if (argv[1])
    n = std::atol(argv[1]);

  uint64_t nth_prime = primesieve::nth_prime(n);
  std::cout << n << "th prime = " << nth_prime << std::endl;

  return 0;
}
```

9.6 previous_prime.c

Iterate backwards over primes using primesieve_iterator.

```
#include <primesieve.h>
#include <inttypes.h>
#include <stdio.h>

int main()
{
  primesieve_iterator it;
  primesieve_init(&it);

  /* primesieve_skipto(&it, start_number, stop_hint) */
  primesieve_skipto(&it, 2000, 1000);
  uint64_t prime;

  /* iterate over the primes from 2000 to 1000 */
  while ((prime = primesieve_previous_prime(&it)) >= 1000)
    printf("%" PRIu64 "\n", prime);

  primesieve_free_iterator(&it);
  return 0;
}
```

9.7 previous_prime.cpp

Iterate backwards over primes using primesieve::iterator.

```
#include <primesieve.hpp>
#include <iostream>

int main()
{
  primesieve::iterator it;
  it.skipto(2000);
  uint64_t prime = it.previous_prime();

  // iterate over the primes from 2000 to 1000
  for (; prime >= 1000;  prime = it.previous_prime())
    std::cout << prime << std::endl;

  return 0;
}
```

9.8 primesieve_iterator.c

Iterate over primes using C primesieve_iterator.

```
#include <primesieve.h>
#include <inttypes.h>
#include <stdio.h>

int main()
{
  primesieve_iterator it;
  primesieve_init(&it);

  uint64_t sum = 0;
  uint64_t prime = 0;

  /* iterate over the primes below 10^10 */
  while ((prime = primesieve_next_prime(&it)) < 10000000000ull)
    sum += prime;

  primesieve_free_iterator(&it);
  printf("Sum of the primes below 10^10 = %" PRIu64 "\n", sum);
  return 0;
}
```

9.9 primesieve_iterator.cpp

Iterate over primes using primesieve::iterator.

```
#include <primesieve.hpp>
#include <iostream>

int main()
{
  primesieve::iterator it;
  uint64_t prime = it.next_prime();
  uint64_t sum = 0;

  // iterate over the primes below 10^10
  for (; prime < 10000000000ull; prime = it.next_prime())
    sum += prime;

  std::cout << "Sum of the primes below 10^10 = " << sum << std::endl;
  return 0;
}
```

9.10 store_primes_in_array.c

Store primes in a C array.

```
#include <primesieve.h>
#include <stdio.h>

int main()
{
  uint64_t start = 0;
  uint64_t stop = 1000;
  size_t i;
  size_t size;

  /* store the primes below 1000 */
  int* primes = (int*) primesieve_generate_primes(start, stop, &size,
      INT_PRIMES);

  for (i = 0; i < size; i++)
    printf("%i\n", primes[i]);

  primesieve_free(primes);
  uint64_t n = 1000;

  /* store the first 1000 primes */
  primes = (int*) primesieve_generate_n_primes(n, start,
      INT_PRIMES);

  for (i = 0; i < n; i++)
    printf("%i\n", primes[i]);

  primesieve_free(primes);
  return 0;
}
```

9.11 store_primes_in_vector.cpp

Store primes in a std::vector using primesieve.

```cpp
#include <primesieve.hpp>
#include <vector>

int main()
{
  std::vector<int> primes;

  // Store the primes <= 1000
  primesieve::generate_primes(1000, &primes);

  primes.clear();

  // Store the first 1000 primes
  primesieve::generate_n_primes(1000, &primes);

  return 0;
}
```
